Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Submitted (23-FEB-2001) Sanger Centre, Hinxton, Cambridgeshire, CB10 15A, UK. E-mail enquiries: humquery@sanger.ac.uk Clone requests: clonerequest@sanger.ac.uk
On Mar 6, 2000 this sequence version replaced gi:7007305.
During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalla; Eutheria; Primates; Catarrhini; Hominidae; 1 (bases 1 to 812) Schmitt,A., Specht,T., Dahl,E., Hinzmann,B., Rosenth Pilarsky,C.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Em: EMBL; Sw: SWISSPROT; TT: TREMBL; Wp:, WORMPEP; Information on the WORMPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep This sequence was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 constructed by the Sanger Centre Chromosome 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest. RP5-105917 is from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     http://www.sanger.ac.uk/HGP/Chr20
This sequence is the entire insert of clone RP5-1059L7 The true left end of clone RP11-402F1 is at 106677 in this sequence. This sequence was finished as follows unless otherwise noted: all

                                                                                                                                                                                                                                                                                                                                                                                                                                                         Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an isolated nucleic acid molecule encoding a CC Mechanically Induced Vascular Receptor (MIVR)-1 polypeptide having CC cardiac cell anti-apoptotic activity and fragments of it provided they are not identical to Genbank sequences AI761441.1, AI594390, CC wall, 00438 and AQ177461. Also included are expression vectors, host CC with a candidate agent, where the molecule is a nucleic acid molecule with a candidate agent, where the molecule is a nucleic acid molecule comprising MIVR-1, IEX-1, VDUP-1, BTG-2 and TIS-11d or its expression product, determining if the anti-apoptotic activity is modulated and thereby identifying a modulator. The cardiac cell anti-cc apoptotic molecules and nucleic acids of the invention are useful for treating, diagnosing and monitoring progression of such diseases and conditative as characterised by increased apoptotic cell-death of vascular endothelial cells e.g. cardiac hypertrophy, myocardial infarction, concars human MTVD-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   720
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 660
```

The present invention relates cancer-associated transcript j

ion relates to methods of detecting transcript in a cell from a patient.

מ

a prostate The method

```
comprises contacting a biological sample from the patient with prostate cancer-associated polynucleotides (designated PC genes) that selectively hybridise to a sequence that is at least 80% identical to them. The prostate cancer-associated polynucleotide sequences are differentially expressed in prostate tumour tissue or in prostate cancer and are derived from the tissues of various organisms such as humans or other mammals (e.g. mice, sheep and dogs). The methods of the invention are useful for diagnosing and treating prostate cancer in mammals. The prostate cancer-associated genes are useful for diagnosing or treating prostate cancer, as well as for identifying modulators of prostate cancer or agents that inhibit prostate cancer. The nucleic acid sequences are particularly useful has 32115-ABK92263 represent prostate cancer-associated polynucleotide

                                                                                                          in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, chemotractic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           numen; nootropic; immunosuppressant; cytostatic; gene therapy; cance. peripheral nervous system; neuropathy; central nervous system; CNS; Alzheimer's; Parkinson's disease; Huntington's disease; heemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation; lentromes.

                                                                                                                                                                                                                                                                                                                                                                                                                                  disorders, atelectasis, pulmonary congestion or oedema, emphysema, chronic bronchitis, bronchial asthma and bronchiectasis, intestinal disorders, spleen associated diseases, modulate renal disorders, treat cardiovascular disorders such as ischemic heart disease, modulate the proliferation, differentiation, and/or function of bone and cartilage cells and to treat bone and/or cartilage associated diseases or disorder. They may also be used to treat disorders associated with the ovaries, cerebral oedema, hydrocephalus, brain herniations, latrogenic disease, inflammations, bacterial and viral meningitis, Alzheimer's pisease, cerebral toxoplasmosis, Parkinson's disease, multiple sclerosi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence encodes a human TANGO 261 polypeptide. The specification also describes TANGO 266, TANGO 216, TANGO 262, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand factor-associated disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, modulate cell adhesion in proliferative disorders, such as cancer, modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and the second control of the control of the control of the control of the cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and the control of the control of the cellular diseases and the control of the cellular advantage and the cellular diseases and the cellular diseases

                                                                                                                              QΥ
                                                                                                                                                                                                                                  CC treating or preventing a disorder associated with decreased corrections or activity of NEUAP. Antagonists of NEUAP are useful for treating or preventing disorder associated with increased expression or activity of NEUAP. NEUAP or their fragments or derivatives are consciular disease, stroke, cerebral neoplasms. Alzheimer's cerebrovascular disease, Huntington's disease, dementia and parkinson's disease. NEUAPs are also useful for treating other cerebral neoplasms. Alzheimer's cerebral and viral meningitis, prion diseases including kuru, Creutrieldt-Jakob disease, nutritional and cerebral including kuru, Creutrieldt-Jakob disease, nutritional and cerebral cerebral cerebral cerebral neoplasms. Alzheimer's developmental disorders of the central nervous system, cerebral cerebral nervous system, cerebral cerebral nervous system disorders, autonomic nervous system disorders, cerainal nerve disorders, peripheral nervous system disorders, cerainal nerve disorders, peripheral nervous system disorders, cerainal nerve disorders, peripheral nervous system disorders, cerainal nerve disorders such as actinic keratosis, mental disorders, peripheral nervous system disorders, ceribral cord diseases, muscular disorders, ceribral cereforms, and toxic myopathies, mental cereforms, cereforms, cereforms, and an autoimmune/inflammatory cereforms, cereforms, and an autoimmune/inflammatory cereforms, cereforms, and an autoimmune/inflammatory cereforms, and peripheral gland, bladder, bone, becast, cervix, and an autoimmune/inflammatory cereforms, and trauma. This sequence was given the Incyte ID no. 1871286BB1.

CC AAA75163-65 encode human TANGO 261 proteins. The specification also CC describes TANGO 266, TANGO 216, TANGO 262, and TANGO 267. The TANGO CC polypeptides can be used to modulate cellular poliferation, modulate cellular differentiation and/or modulate cellular adhesion. The CC disorder, regulate extracellular matrix structuring, cellular adhesion, and cell trafficking and/or migration, modulate cellular interactions, cc modulate cell adhesion in proliferative disorders, such as cancer, cc modulate the proliferation, differentiation, and/or function of cells and hematopoietic associated diseases and disorders, atelectasis, cc and hematopoietic associated diseases and disorders, atelectasis, cc as ischemic heart disease, modulate treat cardiovascular disorders such as ischemic heart disease, modulate treat cardiovascular disorders such cc and/or function of bone and cartilage cells and to treat bone and/or cc artilage associated with the ovaries, and cerebral cedema, cc hydrocephalus, brain herniations, latrogenic disease, inflammations, brain herniations, latrogenic disease, cerebral concephalus and encephalitis, and treat hepatic disease, brain matrices, and cerebral cancers, conceit the present sequence does not appear in the specification; it was created using information provided.

CC AAA75163-65 encode human TANGO 261 proteins. The specification also CC describes TANGO 266, TANGO 267, TANGO 267. The TANGO 267 modulate cellular proliferation, modulate CC polypeptides can be used to modulate cellular adhesion. The CC proteins can be used to treat any von Willebrand factor associated CC disorder, regulate extracellular matrix structuring, cellular adhesion, and coll trafficking and/or migration, modulate cellular interactions, CC modulate cell adhesion in proliferative disorders, such as cancer, CC modulate the proliferation, differentiation, and/or function of cells that appear in the bone marrow, and leukocytes, treat bone marrow, blood and hematopoietic associated diseases and disorders, atelectasis, bronchial CC and hematopoietic associated diseases and disorders, spleen associated CC apilmonary congestion or oedema, emphysema, chronic bronchitis, bronchial CC asthma and bronchictasis, intestinal disorders, spleen associated CC diseases, modulate renal disorders, treat cardiovascular disorders such castischemic heart disease, modulate the proliferation, differentiation, castillage cells and to treat bone and/or function of bone and cartillage cells and to treat bone and/or function of bone and diseases or disorders. cartilage associated diseases or disorder. They may also be used to treat disorders associated with the ovaries, and cerebral oedema, hydrocephalus, brain herniations, iatrogenic disease, inflammations, bacterial and viral meningitts, Alzheimer's Disease, cerebral toxoplasmosis, Parkinson's disease, multiple sclerosis, brain cancers, hydrocephalus and encephalitis, and treat hepatic disorders note: the present sequence does not appear in the specification; it was created using information provided. Novel human and murine secreted proteins designated TANGO 216, 261, 262, 266 and 267 useful as modulating agents of cellular processes, e.g. for treating cancer. Page -; English

           AAA75163-65 encode human TANGO 261 proteins. The specification also describes TANGO 266, TANGO 216, TANGO 267, and TANGO 267. The TANGO polypeptides can be used to modulate cellular proliferation, modulate cellular differentiation and/or modulate cellular adhesion. The proteins can be used to treat any von Willebrand factor-associated

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                           CC The present sequence is one of 3351 sequences in a library of human CC polynucleotides. The library is used to detect differentially expressed CC genes correlated with a cancerous state of a mammalian cell and can CCC detect colon, prostate, breast and lung cancer. The library can be used to produce probes for detection of mRNA and to produce additional copies CC of the polynucleotides. The probes can be used for chromosome mapping of CC the polynucleotide and for detection of transcription levels. Ribozymes CC or antisense oligonucleotides can be generated. The polynucleotides and CC their gene products are used as genetic or biochemical markers (e.g. in CC blood or tissues) that will detect the earliest changes along the CC carcinogenesis pathway and/or monitor the efficacy of therapies and CC untibodies against them can be used in pharmaceutical compositions to CC treat the cancers and proliferative disorders such as neoplasia, XX dysplasia and hyperplasia.

The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and

                                                                                             Qy
                                                                                                                                                                                                    The invention relates to an isolated nucleic acid molecule encoding a CC Mechanically Induced vascular Receptor (MIVR)-1 polypeptide having CC cardiac cell anti-apoptotic activity and fragments of it provided CC they are not identical to Genbank sequences AI761441.1, AI54390, CC NM_00438 and AQ177461. Also included are expression vectors, host CC cells, the MIVR-1 polypeptide, MIVR-1 binding peptides, modulators of CC with a candidate agent, where the molecule is a nucleic acid molecule CC comprising MIVR-1, IEX-1, VDUP-1, BTG-2 and TIS-11d or its expression product, determining if the anti-apoptotic activity is CC modulated and thereby identifying a modulator. The cardiac cell anti-cappototic molecules and nucleic acids of the invention are useful for CC treating, diagnosing and monitoring progression of such diseases and CC endothelial cells e.g. cardiac hypertrophy, myocardial infarction, CC stroke, arteriosclerosis and heart failure. The present sequence CC is one of the four Genbank sequences (AI761441.1) which are homologous to the CDNA for human MIVR-1 and which are specifically disclaimed.
                                                                                                                           Matches

                                                                                                                                                                                                                                                                                           This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. AAZ52858-Z53014 represent expressed sequence tag (EST) fragments derived from a human pancreatic tumor cDNA library and which encode the proteins represented in AAY73814-Y74252.
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim

sequence tags (sESTs), isolated from human, mouse, xenopus and rat tissue sources. The sESTs can have a range of activities depending on the tissues they were isolated from. The activities include: chemotactic; proliferative; immunomodulatory; haematopoietic; chemokinetic; analgesic; haemostatic; thrombolytic; antinflammatory; cytostatic; antibacterial; antifungal; antiviral; antidiabetic; antiasthmatic; vulnerary; antiulcer; osteopathic; neuroprotective;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CC nootropic; antiparkinsonian; antipsoriatic; cerebroprotective;
CC anticonvulsant; and antidepressant. The SESTs can be used for gene
CC therapy and in vaccines. The SESTs are useful as probes for the
CC identification and isolation of full-length cDNAs and genomic DNA
CC molecules which correspond to the SESTs. Proteins encoded by the SESTs
CC are useful in assays for determining biological activity and raising
CC antibodies. They may be useful for treatment of autoimmune disorders
CC (multiple sclerosis, insulin dependent diabetes), allergic conditions
CC (asthma), myeloid or lymphoid cell deficiencies, wounds, burns, ulcers,
CC osteoporosis, osteoarthritis, central nervous system disorders
CC (Alzheimer's, Parkinson's, Huntington's disease, stroke), coagulation
CC disoase), tumours, bacterial, fungal or viral infections, depression and
CC gsoriasis. AAA43420 to AAA43425 represent linker variants which are given
CC in the exemplification of the present invention.
